Test Report

Test Name	Results	Units	Bio. Ref. Interval
HEPATITIS C VIRUS ANTIBODY (Anti-HCV) (ECLIA)	0.07	Index	<0.9

Interpretation

RESULT (INDEX)	REMARKS
<0.9	Non Reactive
0.9-1.0	Borderline Reactive
>=1.0	Reactive

Note

- False positive results are seen in Autoimmune diseases, Rheumatoid factor, Hypergammaglobulinemia, Paraproteinemia, passive antibody transfer, Anti-Idiotypes & Anti superoxide dismutase
- False negative results are seen in early Acute infection, Immunosuppression & Immuno-incompetence
- HCV-RNA PCR recommended in all reactive results to differentiate between past & present infection
- Test conducted on serum

Comments

Hepatitis C (HCV) is an RNA virus of Flavivirus group transmitted via blood transfusions, transplantation, injection drug users, accidental needle punctures in healthcare workers, dialysis patients and rarely from mother to infant. 10% of new cases show sexual transmission. As compared to HAV & HBV, chronic infection with HCV occurs in 85% of infected individuals. In high risk populations, the predictive value of Anti HCV for HCV infection is > 99% whereas in low risk populations it is only 25%.

Uses

- Indicator of past or present infection, but does not differentiate between Acute / Chronic / Resolved infection
- Routine screening of low and high prevalence populations including blood donors

Test Report

Test Name	Results	Units	Bio. Ref. Interval
HEPATITIS B SURFACE ANTIGEN (HBsAg) RAPID SCREENING TEST (Sandwich Immunochromatography)	Non-Reactive		Non-Reactive

Interpretation

RESULT	REMARKS
Reactive	Indicates presence of Hepatitis B Surface Antigen.
Non-Reactive	Indicates absence of Hepatitis B Surface Antigen.

* All reactive results should be subjected to HBsAg Neutralization test which can be requested as Test Code S116.

Note

1. This is a screening test and the result should be interpreted in conjunction with clinical findings and other diagnostic tests.
2. This assay is used for qualitative detection of Hepatitis B Surface Antigen (HBsAg) in serum samples and cannot differentiate between the stages of Hepatitis B viral infection. Detection of HBsAg may be observed in Hepatitis B viral infection for transient period of time after HBV vaccination.
3. The Hepatitis B Surface Antigen Rapid Test cannot detect less than 1 ng/mL of HBsAg in specimens. Sensitivity and Specificity of this HBsAg test by Immunochromatography is 99.8% and 99.2% respectively.
4. False negative reaction may be due to processing of sample collected early in the course of disease or presence of mutant forms of HBsAg.
5. For monitoring HBsAg levels, Quantitative HBsAg assay is recommended.
6. Test conducted on serum.

Comment

Hepatitis B Virus (HBV) is a member of the Hepadna virus family causing infections of the liver with variable clinical features. Hepatitis B is transmitted by blood and body fluids, sexually and from mother to fetus. In most cases HBV hepatitis is self limiting, but 1-2% adolescents and adults develop Chronic Hepatitis. Frequency of chronic HBV infection is 5-10% in immunocompromised patients and 80% in neonates.

Test Report

Test Name	Results	Units	Bio. Ref. Interval
HIV RAPID SCREENING TEST (Immunochromatography)	Non-Reactive		
Final Result :	Negative		

REMARKS	INTERPRETATION
Reactive	Indicates Presence of antibodies to HIV 1/2 virus
Non-Reactive	Indicates absence of antibodies to HIV 1/2 virus

It is advised to verify all positive results by conducting the supplemental HIV 1 and HIV2 antibody confirmation and differentiation, LIA (S315).

Note

1. Positive test result indicates antibody detected against HIV-1/2.
2. Negative test result indicates antibody is not detected against HIV- 1/2.
3. Indeterminate test result indicates antibody to HIV-1/2 have been detected in the sample by two of three methods.
4. False positive results may be observed in Autoimmune diseases, Alcoholic hepatitis, Primary biliary cirrhosis, Leprosy, Multiple pregnancies, Rheumatoid factor, and due to presence of heterophile antibodies.
5. False negative results may occur during the window period and during the end stage of the disease.

Recommendations

1. Post-test counseling available between 9 am to 5 pm at LPL laboratories.
